

# BO20E-05 Anti collision system

Enable	<p>The anti collision system contains procedures that tells each train what to do in certain situations. It is mainly based on the positions of the trains and their next position. In simple terms it compares their current position with their next position and avoids their position to become the same.</p> <p>The cameras have their own anti-collision system, when two trains are within the camera area the train with the highest speed will stop. Another case is when a train moves forward and the other backwards, then the both of the trains will stop if they come too close. It is set a minimum distance between the trains in the camera area for avoiding a collision.</p>	TrainData
